

Customs & Shipping Document Check

One-page brief — SilverTrust Brief Project

By: Janaina Hoffmann (Consultant) **For:** logistics team

The problem

Every shipment needs an invoice, a packing list, and the right customs code (HS code) before it can cross the border. Right now, someone checks these documents by hand against the destination country's rules. When something doesn't match — a wrong code, missing information — the shipment can get stuck at customs. This costs extra money in storage and handling, and it happens often enough that the team already has a routine for fixing it.

Recommended solution

A tool that checks shipment documents before they go out. It reads the invoice, packing list, and product information, compares them with the destination's rules, and flags anything missing or inconsistent right away — before it becomes a delay. It also suggests a possible customs code (HS code) and shows where that suggestion came from, so someone can check it quickly. A team member still reviews and approves everything; the tool prepares the work, it does not decide.

Why this fits

This is the exact task the team already does by hand every day, and it is the one causing repeated, avoidable delays. The tool does not remove the team's judgment or the broker relationship — it just removes the slow, manual first pass so people can focus on the cases that really need a human decision.

What we are not doing (for now)

Not automating the customs filing itself, and not covering every shipping route on day one. We start with one route to see if it really saves time.

Next step

Run a small pilot: pick a handful of past shipments from one route, run them through the document check, and compare the time it takes with how it's done today. If it saves real time, we talk about expanding to more routes.
